

INTRODUCTION

ChatGPT is a language model that can interpret and carry on natural human language conversations. It can now output a wide range of text and code after rigorous training on varied text samples. ChatGPT is a computer programme that simulates human speech and comprehension. It understands how to mix words into phrases because it has read several books and articles. Based on the input, it can complete a sentence, answer questions, and generate new information. It is adaptable enough to translate languages, summarise documents, and respond to specific enquiries. You can find some answers there, but you should double-check the information before using it. While ChatGPT appears to be the ideal teaching tool, keep in mind that it cannot replace the requirement for students to acquire critical thinking and interpersonal skills. ChatGPT may have a variety of consequences on students and educators depending on how it is implemented in schools.

Along with the growth of big data, machine learning, and artificial intelligence (AI), intelligent services have been extensively applied in information technology. Artificial intelligence has been utilised in clinical practise and nursing education as a result of educational restrictions caused by the coronavirus disease (COVID-19) pandemic. Furthermore, traditional classes have given way to online video lectures and other types of remote education. As a result, attempts to encourage interactions between instructors and students, as well as methods to increase students' self-directed learning, are required. As a result, there has been a spike in interest in using chatbots in classrooms. A chatbot, or "talking bot," as demonstrated in the study, is an increasingly popular piece of software in information technology; it can hold natural-sounding conversations with human users and meet their demands in a Q&A format.

The utility of a chat bot in the classroom is multifarious since it allows students to learn whenever and wherever they choose. Students' reduced stress levels while interacting with chatbots and practising new abilities are another benefit, in addition to increasing the efficacy of self-directed learning. Furthermore, it enables for real-time user feedback during the learning process through dialogues and reacts with customised content depending on that input. As a result of artificial intelligence advancements, a chatbot can educate people who would otherwise be unable to do so for a variety of reasons. Many students, professors, presenters, researchers, and members of the general public have differing perspectives about ChatGPT, whether favourable or bad. As demonstrated in the study, numerous institutions may support and ensure that AI is used ethically and beneficially. It is vital to teach students about artificial

intelligence (AI) and its limitations, as well as to encourage ethical and responsible AI use, cultivate critical thinking, and provide students with the tools they will need to adapt to a quickly changing technological landscape. In this regard, the purpose of this research is to determine the influence of ChatGPT on students, particularly in Peru, by demonstrating how the cost of ChatGPT, rate of task completion, and assessment of why students choose ChatGPT affects ChatGPT usage.

STATEMENT OF THE PROBLEM

The researcher examined the students' perceptions and levels of satisfaction with Chat GPT in Coimbatore. Previous research focused on the awareness Behaviour Strategies, and techniques for using Chat GPT. The pupils are aware of the source for collecting data from numerous apps, but it takes more time, data, and so on. As this Chat GPT is crucial in providing the necessary content in a fraction of a second. As a result, the researcher applied this to perception and pleasure.

OBJECTIVES OF THE STUDY

The following objectives of the study on

- To learn about the use of GPT chat among the student community.
- To determine the amount of awareness among chat GPT users.
- To investigate the numerous issues encountered by the student community while using GPT chat.
- To assess the level of user satisfaction with chat GPT.

SCOPE OF THE STUDY

The Chat GPT is commonly used by all people in all fields based on their demands. The students' current trend community was able to provide more knowledge and up-to-date technology in and across the world on time. The Chat GPT assists them in providing data and enables them to acquire additional concepts needed in academic subjects.

SIGNIFICANCE OF THE STUDY

- It mimics human interaction.
- It allows for more personalised customer support interactions.
- It also drives more efficient communication methods.
- It has the capacity to rapidly assess large amounts of data.

LIMITATIONS OF THE STUDY

- The study only encompassed the city of Coimbatore.
- Because the information was received by a questionnaire, it may not be reliable because it was gathered from diverse individuals.
- The information gathered by the Chatbot may be incorrect.

RESEARCH METHODOLOGY

A research technique is a methodical approach to solving a research challenge. It is how scientific research is conducted. It contains of many stages that are often taken by a researcher to explore the research problem, as well as the logic behind them. The data was gathered from both primary and secondary sources.

a) Primary data

Structured questionnaires were created in order to acquire primary data from respondents. The questionnaire is designed to be straightforward and easy to use, allowing respondents to express themselves freely and honestly.

Sampling size and population

The sample size is 150, collected from the different respondents.

REVIEW OF THE LITERATURE

Fawaz Qasem (2023) The goal of this study is to investigate future concerns and assurances concerning the nature of the recently developed artificial intelligence (AI) language model-based application, ChatGPT, for use in scientific research and academic works and assignments. The purpose of this study is to investigate the good and negative aspects of researchers' and students' use of ChatGPT. This study suggests some practical academic methods and suggestions that can assist researchers and publishers in reducing the percentage of unethical works such as plagiarism.

Ting Wang (2023) ChatGPT has the potential to progress academia and librarianship in both frightening and fascinating new ways. However, in the race to create new scholarly knowledge and educate future professionals, it is critical to consider how to use this technology responsibly and ethically, as well as how we, as professionals, can work alongside this technology to improve our work rather than abuse it or allow it to abuse us.

David Baidoo-Anu (2023) ChatGPT, a generative AI tool, astounded the globe with its remarkable ability to perform amazingly complex jobs. ChatGPT's amazing skills to accomplish complicated tasks in the realm of education have elicited varied reactions from educators, as this innovation in AI appears to revolutionise established educational praxis. This is an exploratory study that synthesises recent available literature to give some potential advantages and disadvantages of ChatGPT in boosting teaching and learning. ChatGPT benefits include, but are not limited to, the promotion of personalised and interactive learning, the generation of prompts for formative assessment activities that provide continuing feedback to enhance teaching and learning, and so on.

Muhammad Shidiq (2023) In the area of education, artificial intelligence offers numerous benefits, including the use of technologies such as virtual mentors, voice assistants, new material, smart classrooms, autonomous evaluation, and personalised learning. On the other hand, there is the ChatGPT system, an AI-based chatbot capable of producing text in a variety of formats—whether formal, informal, or creative writing—that provides educational issues. ChatGPT's ease of digesting information from text input limits the originality of output, making it uncreative. The Chat-GPT system's capacity to grasp human language makes it relatively simple to write creatively, such as poems, short tales, novels, or other sorts of writing whose quality is comparable to human effort.

Mehmet Firat (2023) In the framework of existing literature, the potential benefits of AI in education, as well as the obstacles and barriers that may result from its incorporation, are examined. Based on these findings, future research should focus on further investigating the ethical implications of AI for education, developing strategies to address privacy concerns, and investigating how educational institutions can best prepare for the integration of AI technologies. The report finishes by emphasising the necessity of recognising the potential benefits and challenges of AI in higher education, as well as the need for ongoing research in this field.

Garcia Penalvo,F.J. (2023). The year 2022 concluded with one of those technical discoveries with unpredictable behaviour, a black swan, dominating traditional and digital media. It is, indeed, ChatGPT. Although artificial intelligence has previously been in the headlines and was frequently veiled by other terms, the ChatGPT phenomena has pushed this discipline and its beneficial and negative implications on our society to the forefront once more. Reactions to its release have ranged from the joy of inventors and early users to the almost apocalyptic horror of the Terminator film, motivated mostly by its ease of access and use. Because of its remarkable potential to generate texts that may very easily pass for human inventions, the most relevant argument focuses on its consequences in Education and Academia. We are at the dawn of a technology that has progressed from a fun tool to a contender for disruptive innovation.

Ali et al., (2023). In the healthcare industry, Gen-AI/ChatGPT promises to help create unparalleled levels of operational efficiency. For example, Gen-AI/ChatGPT can improve overall process efficiency, including accuracy in drafting patients' clinic letters, resulting in increased customer satisfaction.

Biswas, (2023) In terms of global warming and other climate issues, the same technology is well suited to mitigating their effects. It can especially help with climate projections, model parametrization, interpretation, scenario modelling, and environmental assessments.

Nature Editorial, (2023). All of this has prompted academics to discuss the true role of Gen-AI/ChatGPT, as well as the necessity to establish guidelines for AI-related ethical practises in the education and research domains..

Chandan Kumar Tiwari et al., (2023). According to the findings of the study, students favour the employment of ChatGPT in the classroom. The tool's usefulness, social presence, and validity, as well as fun and motivation, all contribute to a positive

attitude towards utilising it in a learning setting. However, perceived simplicity of use was not proven to be a significant predictor of student acceptance and utilisation of ChatGPT.

Pawan Budhwar et al., (2023) ChatGPT and its versions that use generative artificial intelligence (AI) models have quickly become a focus point in academic and media discussions regarding their potential benefits and drawbacks in a variety of sectors of the economy, democracy, society, and the environment. It is uncertain if these technologies result in employment displacement or creation, or whether they just move human labour by producing new, potentially inconsequential or practically irrelevant, information and decisions.

Tira Nur Fitria. (2023) ChatGPT is a product of AI that is currently being widely discussed on Twitter. This research reviews how ChatGPT writes English essays. This research is descriptive qualitative. The analysis shows that we can access ChatGPT on openai.com or chat.openai.com on the browser. If we do not have an account, we register via email, Google, or Microsoft account. After login, enter a question or statement in the conversation column provided. Send it and ChatGPT will respond and the answer appear quickly.

Simone Grassini. (2023) Over the last decade, technological advancements, especially artificial intelligence (AI), have significantly transformed educational practices. Recently, the development and adoption of Generative Pre-trained Transformers (GPT), particularly OpenAI's ChatGPT, has sparked considerable interest. The unprecedented capabilities of these models, such as generating humanlike text and facilitating automated conversations, have broad implications in various sectors, including education and health. Despite their immense potential, concerns regarding their widespread use and opacity have been raised within the scientific community.

Randy joy magno ventayen. (2023). A recently developed artificial intelligence (AI) model to execute high-level cognitive tasks known as ChatGPT has been popular over the last months in the academic community. The feature raises questions regarding how ChatGPT may be used for academic dishonesty for students who generate essays and topics. The study discovered that ChatGPT poses a potential risk to the integrity of essay submissions, particularly in higher education settings where such requirements are standard. This study will check the similarity index of ChatGPT-generated results using Original by Turnitin and running in a paraphrasing too

Minseong Kim. (2023) The results contribute to the field of human–computer interaction by investigating the motivations for utilizing generative AI chatbots and advancing our comprehension of AI creepiness, trust, and continuance intention. The practical ramifications of this research can inform the design of user interfaces and the development of features for generative AI chatbots.

Ben Niu (2023). First, information quality significantly and positively affects users' satisfaction, perceived usefulness, and coolness. Second, perceived usefulness, coolness, technology affinity, and posthuman ability also have a positive impact on users' satisfaction, which subsequently influences their loyalty to the AI chatbot. Furthermore, the findings demonstrate that user ethical perceptions and beliefs negatively moderate the relationship between satisfaction and loyalty. The main implication of this research is that brand managers and programmers should regularly assess the chatbot's performance to ensure that the information provided is relevant, reliable, concise, and delivered promptly.

Tiffany Petricini & other (2022). ChatGPT was released to the public in November 2022, and there were million registered users within two months. This rapid expansion sparked increased attention and questions concerning AI.

Chen et al., (2021) Prior research on AI perceptions is limited, but it reveals a range of understandings and levels of optimism. According to a consumer research, consumers frequently likened AI to humans.

Angelov et al. (2021) The alarming bias against utilising digits in numbers among the ChatGPT group should be highlighted. The author of the study discovers that the most popular number generated by ChatGPT is also the most popular in human preference, implying a significant association between the two. ChatGPT has benefits and drawbacks as a conversational agent, which he discusses.

ABOUT

ChatGPT (Chat Generative Pre-trained Transformer) is a big language model-based chatbot developed by OpenAI and released on November 30, 2022, that allows users to improve and steer a discussion towards a preferred duration, format, style, degree of information, and language utilised. At each dialogue stage, successive prompts and responses, known as prompt engineering, are considered as a context. ChatGPT is based on GPT-3.5 and GPT-4, which are members of OpenAI's proprietary series of generative pre-trained transformer (GPT) models based on Google's transformer architecture, and is fine-tuned for conversational applications using a combination of supervised and reinforcement learning techniques. ChatGPT was initially offered as a free research preview, but due to its popularity, OpenAI currently offers the service on a freemium basis. It gives free users access to the GPT-3.5-based version. Paid users, on the other hand, receive the more complex GPT-4-based version and priority access to updated features under the commercial brand "ChatGPT Plus."

By January 2023, it had become the fastest-growing consumer software product in history, with over 100 million users, leading to OpenAI's valuation of US\$29 billion. Google, Baidu, and Meta pushed the development of their competing products, Bard and Ernie Bot, within months. Microsoft launched Bing Chat, which is built on OpenAI's GPT-4. Some observers voiced concern over ChatGPT's potential to displace or atrophy human intelligence, as well as its ability to facilitate plagiarism or feed misinformation.

Features of Chat GPT

- **Natural Language Understanding**- Based on the input it gets, ChatGPT can interpret and generate human-like text.
- **Text Generation** - It may produce text for a variety of activities, such as answering questions, composing essays, generating conversational responses, and so forth.
- **Conversational Capabilities** - ChatGPT is meant to engage in natural-sounding discussions and multi-turn exchanges.
- **Multilingual Support** - It can understand and generate text in a variety of languages, making it adaptable to a global audience.
- **Customization** - ChatGPT can be fine-tuned by developers for specific activities and domains to improve performance in specialised scenarios..
- **Text Summarization** - It can condense long passages of text into shorter, more comprehensible summaries.

- **Language Translation** - Because ChatGPT can conduct language translation duties, it can be used to bridge language boundaries.
- **Text Completion** - It can help with sentence or paragraph completion, making it ideal for content generation.
- **Access to the Knowledge Base** - It has access to information until the knowledge cutoff date in September 2021, so it can deliver information and answers based on that knowledge.
- **API Integration** - Using OpenAI's API, ChatGPT may be incorporated into a variety of applications, products, and services, allowing developers to take advantage of its features.
- **Contextual Understanding** - It can keep context throughout a conversation, grasp references, and keep responses coherent.
- **Paraphrasing** - It can rewrite sentences or paragraphs while preserving the original meaning, which is useful for reworking content.

Scopes of Chat GPT

Chat GPT has the ability to significantly improve the online learning experience. Here are some of the most promising Chat GPT applications in online learning.

➤ **Gamification**

Create engaging gamified learning experiences using Chat GPT that boost learners' motivation and material retention.

➤ **Collaborative Learning**

Encourage learner cooperation with Chat GPT, allowing for the development of teamwork and communication skills for a social learning experience.

➤ **Adaptive Learning**

Use Chat GPT for adaptive learning, which provides personalised content and support to keep learners interested, motivated, and on pace to reach their objectives.

ADVANTAGES OF CHATGPT

Artificial intelligence advancements have resulted in the invention of Chat GPT, a game-changing technology that generates human-like responses to natural language questions. While Chat GPT has several advantages, such as natural language production and scalability, it also

has some drawbacks. In this part, we will go over the benefits and drawbacks of Chat GPT in greater depth.

➤ **Efficient customer communication**

Chat GPT enables businesses to reply quickly to client inquiries. The system can manage a huge number of requests at once and provide rapid results. This reduces wait times and boosts customer satisfaction.

➤ **24/7 support**

Chat GPT may be accessed 24 hours a day, seven days a week, allowing businesses to provide help to their customers around the clock. This is especially useful in worldwide marketplaces with customers from different time zones. Customers can ask inquiries and obtain assistance at any time of day or night.

➤ **Scalability**

Chat GPT enables businesses to effortlessly increase their support capacity without hiring extra personnel. Depending on demand, the system can accommodate hundreds or even thousands of simultaneous chats. This enables businesses to adapt swiftly to rising customer demand without sacrificing support quality.

➤ **Diversity**

Chat GPT can be used for a multitude of purposes, including customer service and content development. It can give you information, answer your queries, make recommendations, and even manage complex activities like scheduling or order processing. Because of its versatility, Chat GPT is a significant tool for businesses looking to optimise their workflows and boost efficiency.

➤ **Multilingual communication**

Chat GPT supports various languages and provides real-time translations. This enables businesses to access clients all over the world and connect with them in their native language. The ability to transcend language barriers creates new chances for international business collaborations and enhances the user experience for clients all over the world.

➤ **Improving the user experience**

Chat GPT offers a personalised and engaging user experience. It can use prior interactions to comprehend the situation and provide appropriate responses. This improves the user experience by making dialogue more natural. Chat GPT can also

be upgraded continuously using machine learning to produce progressively more precise and relevant responses.

DISADVANTAGES

➤ **Limited control over generated content**

The Chat GPT is trained using enormous volumes of text data from the internet. As a result, there's a chance the model will produce erroneous, biased, or even insulting results. Although businesses can take steps to prevent these issues, control over generated material remains restricted.

➤ **Spreading misinformation**

Because Chat GPT may create text, there's a chance it'll be abused to promote misinformation or fake news. Based on the training data, the model may deliver erroneous or unconfirmed information. It is critical to monitor the quality of generated information and verify its dependability. As a result, double-checking the facts is critical.

➤ **Lack of emotional intelligence**

Despite its ability to replicate natural communication, Chat GPT lacks the emotional intelligence of a human discussion partner. It may struggle to perceive and respond effectively to nuanced communication nuances. This can cause user annoyance or misunderstanding.

➤ **Privacy and security concerns**

The use of Chat GPT necessitates data and information communication with the system. This raises concerns about data privacy and security. To guarantee that sensitive data is safeguarded and does not get into the wrong hands, adequate security measures must be implemented.

➤ **Dependence on technology**

The growing reliance on chat GPT and other similar technologies threatens undermining human skills and interpersonal relationships. It is critical to strike a balance and ensure that technology is used as a tool to complement rather than replace human connection. Then, as previously noted, it may be able to address the skills shortage.

IMPLEMENTATION AND WORKING OF CHATGPT

ChatGPT is built using a deep neural network architecture comprised of multiple layers of transformers. These transformers are intended to process sequential input such as natural language text and produce coherent and human-like outputs. A vast corpus of text data is given into ChatGPT to train it, helping it to discover patterns and relationships between words, phrases, and sentences. The training process is iterative, and the model improves as more data is fed into it [8]. ChatGPT can be fine-tuned for specific applications or activities, such as language translation or content generation, once taught.

ChatGPT's operation can be divided into various steps. The user begins by entering a prompt or query into the system. The model processes the prompt and generates a response based on its understanding of language patterns and relationships. The user can then continue the chat or ask another question after receiving the response. Reinforcement learning using human feedback is used to train this approach totally.

RLHF Training Method of ChatGPT

The capacity of ChatGPT to generate coherent and natural-sounding responses is critical to its success. This is accomplished by allowing the model to process and produce text sequences. The model is also trained on a vast corpus of text data, which allows it to grasp language nuances and deliver contextually relevant responses.

ChatGPT's implementation and operation are complex and advanced. However, the end product is a system capable of producing human-like responses to a variety of cues and inquiries. We hope to see more specialised applications and use cases develop as ChatGPT evolves and improves.

ChatGPT Showing False Response

ALTERNATIVES OF CHATGPT

For natural language processing and automated conversation tasks, there are several alternatives to ChatGPT. Because of Microsoft's investment in ChatGPT, several firms, including Google, have developed AI-based chatbots. Google's Bard is an AI-powered chatbot created to supplement the search engine and built with the LaMDA language model, which is similar to Chat GPT 3.5. It functions similarly to Chat GPT in that it can create replies on a variety of topics and will provide a user-friendly response. Bard transforms the Google search engine into a fun virtual assistant. Based on their design methodologies, all of these chatbots have different possibilities. Some of the most innovative design techniques and chatbot varieties are listed here.

- A. Rule based Chatbots.
- B. Retrieval based Chatbots.
- C. Generative Adversarial Networks
- D. Hybrid Approaches

All the Chatbots currently designed or implemented by any organization are based on the above four approaches.

- A. Rule-Based Chatbots:** Chatbots with rules are a popular alternative to ChatGPT. Instead than employing natural language processing to create responses, these chatbots respond to user questions using predefined rules. This method can aid in the completion of small, straightforward tasks such as giving critical customer service support or answering frequently requested inquiries. Rule-based chatbots, on the other hand, may require assistance with more complicated queries since they lack the ability to read natural language and understand the nuances of human communication. Revechat.com is an example.
- B. Retrieval-Based Chatbots:** Chatbots based on retrieval are another option to ChatGPT. These chatbots save a database of predetermined responses to frequently asked questions and then extract the most relevant response based on the user's input. This method can be useful for dealing with a wide range of user queries, allowing chatbots to react fast and accurately. However, retrieval-based chatbots are constrained by their predefined response database, which can lead to repetitive or generic responses that fail to satisfy the user's individual demands. Mitsuku is one such case.
- C. Generative Adversarial Networks (GANs):** GANs are artificial intelligence models capable of producing text and other forms of content. GANs, unlike ChatGPT, are not explicitly designed for conversational applications, but they can be trained to generate natural language responses. GANs are capable of producing high-quality, cohesive text, but they require a huge quantity of training data and are computationally expensive to train.
- D. Hybrid Approaches:** Conversational AI hybrid approaches incorporate techniques such as rule-based systems, retrieval-based systems, and machine learning models such as ChatGPT. These approaches can deliver the advantages of each strategy while minimising their drawbacks. A hybrid solution, for example, could utilise a rule-based system for simple inquiries and a machine learning model like ChatGPT for more complicated queries. While hybrid systems are more difficult to create and execute than separate strategies, they offer a more robust and adaptable solution for conversational AI applications.

HOW TO USE CHATGPT

ChatGPT is a chatbot driven by artificial intelligence that allows users to create custom chats using a natural language processing-based interface. It is meant to allow users to rapidly and easily create dialogues for any purpose, from customer service to sales and marketing. To utilise ChatGPT, users must first create an account and then add an AI instance. Then they

must build a dialogue by incorporating various elements such as questions, answers, and user choices. They can also utilise criteria and triggers to modify the conversation and control the flow of the chatbot. After creating the chat, the user can preview and test it to ensure that everything works as expected. The user can publish the dialogue so that others can use it. They can also monitor the performance of the chat and alter the parameters accordingly. This allows the user to guarantee that their chatbot gives the best possible experience.

Below is the step-by step process

Step 1: They can also monitor the performance of the chat and alter the parameters accordingly. This allows the user to guarantee that their chatbot gives the best possible experience.

Login page of Chat GPT

Step 2: Please sign in to your account. You can access the ChatGPT dashboard after creating an account.

Step 3: Start a conversation. Click the "Create Conversation" button and fill out the conversation data, such as the title, participants, and topic.

Home Screen of Chat GPT

Step 4: Begin the dialogue. You can begin conversing with your participants once the conversation has been formed.

Step 5: Use the natural language processing (NLP) tools built into ChatGPT. ChatGPT includes a sophisticated NLP engine that can assist you in understanding.

IDEAS AND FUTURE RESEARCH RELATED

To field-based chat GPT

ChatGPT occasionally sends an inaccurate or delayed response due to the massive volume of data it processes. Future research can be undertaken to train the ChatGPT model more correctly by dividing the subject areas. The sample snapshot of the proposed model where we can select sub-topics is shown below. Instead of travelling, it will hit the specific data collection based on the sub-topics.

Proposed Model of ChatGPT

ChatGPT efficiency will enhance as a result of filtering the sub-topics because it will only be dealing with limited datasets. Based on the aforementioned paradigm, we can create ChatGPT for Jobs, Research, Scholars, Academics, health care, Sports, and information technology tools

such as SQL, Big Data,.net, Python, and Java. This will also benefit organisations that interact with consumers by introducing this technology to clients so that if they have any important difficulties, they can use this tool instead of contacting product support directly. Because of the quick reaction they receive while utilising chat GPT, it will generate quality customer support and service.

IMPACT OF CHATGPT ON DIFFERENT FIELDS

A. Academics

ChatGPT has the ability to transform academia. It can assist students grasp concepts they are having difficulty with by delivering personalised, interactive explanations. Teachers may also use the AI-powered system to deliver personalised feedback to individual pupils, saving them time and effort. ChatGPT can also be used to grade assignments and tests, as well as offer students with automatic feedback. ChatGPT can also be used to build unique projects and resources. It can, for example, be used to develop interactive games and activities that involve pupils more deeply. It can be used to build intelligent tutors who provide students with personalised assistance and feedback as they advance through their courses.

B. Cyber Security

ChatGPT has made a significant contribution to cyber security, where it may be used to detect and prevent cyber-attacks. The language model can assist in identifying phishing emails by analysing the language used in the email and discriminating between authentic and fraudulent communications. ChatGPT can assist in malware detection by identifying malicious code by analysing the language used in the code. Furthermore, ChatGPT can be used to generate complicated and one-of-a-kind passwords that are tough to guess.

C. Customer Support

ChatGPT can improve customer support services by delivering personalised assistance. It can be used to build virtual agents who can provide personalised support and advice to customers. These virtual agents can be programmed to understand and respond to customer demands. Furthermore, ChatGPT can be utilised to create automated systems capable of detecting possible client problems and providing timely solutions. It can, for example, be used to create automated systems that can recognise client complaints and deliver remedies on their behalf.

It can be used to develop intelligent customer care agents who can deliver personalised services and advise to customers.

D. HealthCare

ChatGPT can improve healthcare services by offering doctors and other healthcare workers with personalised help. It can be utilised to create automated systems that deliver personalised advice and recommendations to medical practitioners [3]. It can, for example, be used to develop intelligent health systems that offer personalised medical advice based on a patient's medical history. Furthermore, ChatGPT can be utilised to create systems that detect potential health issues and deliver prompt treatments. It can also be used to develop virtual agents that provide personalised health advice and support to patients. As a result of their direct engagement with patients, chatbots will have a significant positive impact in the healthcare industry, alleviating patients' privacy worries.

E. Software development

ChatGPT has made a significant contribution to the software development business. It has given software developers the ability to include natural language processing (NLP) capabilities into their products, making them more dynamic and user-friendly. In recent years, NLP-based technologies such as chatbots, virtual assistants, and other conversational interfaces have risen in popularity. ChatGPT can be used by developers to create more complex and intelligent chatbots that can understand and respond to user queries in a more humanistic manner. This technology has also simplified the integration of machine learning and artificial intelligence capabilities into applications. As a result, ChatGPT's software development possibilities have broadened, making it more intuitive, amusing, and effective.

F. Jobs

ChatGPT has had a dual influence on jobs. On the one hand, it has resulted in the creation of new job opportunities in areas such as natural language processing, artificial intelligence, and machine learning. As the need for these abilities grows, so does the need for specialists who can work with ChatGPT and similar technologies. ChatGPT, on the other hand, has had an impact on established jobs.

Chatbots and virtual assistants, for example, are increasingly being utilised to address customer support inquiries, eliminating the need for human customer service employees. This tendency is likely to continue as chatbot technology advances and becomes capable of doing increasingly complicated jobs. It is important to recognise, however, that while ChatGPT may replace certain occupations, it will also create new ones. Finally, it has the potential to boost production and efficiency in a variety of businesses

G. Information Technology

ChatGPT has had a substantial impact on the world of information technology (IT). It has transformed our interactions with technology and made it easier for people to acquire and use information. Chatbots and virtual assistants are increasingly widely employed in industries such as customer service, healthcare, and e-commerce, among others. To interpret and respond to user queries, they rely on NLP technology. ChatGPT has also facilitated the creation of more sophisticated search engines and recommendation systems capable of providing more accurate and personalised results. Furthermore, ChatGPT has expanded the scope of cybersecurity and data analysis, allowing IT professionals to discover and respond to threats more rapidly and efficiently. ChatGPT will eventually replace customer support jobs, saving any organisation a significant amount of money because customers would use ChatGPT for initial assistance before contacting customer support. In most circumstances, ChatGPT will resolve the issue, reducing the volume of incoming cases or incidents and allowing the organisation to minimise manpower. As a result, it may have a negative influence on the job market due to a drop in jobs involving customer service.

H. Researchers and Scholars

ChatGPT has had a substantial impact on a wide range of researchers and scholars. It has, in particular, transformed how we approach natural language processing and artificial intelligence research. ChatGPT has simplified the development and testing of new NLP models, as well as the analysis and interpretation of vast amounts of text data [9]. It has also enabled researchers to develop more sophisticated chatbots and conversational agents that can be used for a variety of applications such as education, healthcare, and therapy. ChatGPT has also improved academics' ability to cooperate and share data, as well as access and analyse massive datasets from a number of sources.
